SUMMARY

Frontend developer with 3.5+ years of commercial experience. Main stack: React and TypeScript. I have worked on large government and industry systems: microfrontends, complex multi-step forms, role-based access.

For over a year I was the only frontend developer on a 15-module platform, then handed it over to a new team and mentored two developers. I enjoy bringing order to architecture and builds: splitting the UI kit cut load time from 12 to 1.5 seconds, eliminating circular dependencies reduced package installation from 10 minutes to 50 seconds, and migrating a project from CRA to Vite went hand in hand with introducing linting and tests.

I spent six months writing Angular and Vue commercially, so I adapt easily to a team's stack.

Two years of active AI use in development (Cursor, Claude, Codex, Perplexity). I'm currently building a personal project with these tools.

EXPERIENCE

LANIT Moscow

Frontend Developer *September 2022 - April 2026*

State Register of Medicinal Products *11.2025 - 04.2026*

Applicant portal for submitting and tracking applications for medicinal products. 16 frontend developers from several companies.

Stack: React 18, TypeScript, Vite, Zustand, SWR, React Hook Form, Yup, React Router, Tailwind CSS, Jest, React Testing Library

- Owned the orphan drug designation module end to end: a 5-step application form with nested subforms and validation, drafts, and the full application lifecycle (requests, responses, tasks, decisions, withdrawal).
- Implemented application version comparison with change highlighting and covered the algorithm with unit tests.
- Built a reusable versioned document tree (data adapter, file merging and replacement) and covered it with tests.
- Centralized role-based route access in a single config and rewrote HTTP 403 access error handling. Replaced about 600 lines of navigation configuration with a shared config.
- Migrated the build from Create React App to Vite. Introduced ESLint, Prettier, Husky and Jest.

Moscow Urban Economy Complex Control Center *03.2025 - 10.2025*

A platform for monitoring and coordinating municipal services and urban infrastructure. 2 frontend developers.

Stack: Angular 17, RxJS, Vue 2, TypeScript, Leaflet, 2GIS, Keycloak

- Owned the calendar scheduler: reworked the problematic event creation form and extended its functionality (recurring events, export, custom input fields, access permissions).
- Developed a “Screenshot to PDF” widget: dashboard screenshots with state preservation, assembly into a template and export of the presentation to PDF.
- Built an Angular section for the urban improvement requests registry: filterable tables, detail cards, an interactive map (Leaflet + 2GIS) with layers for house territories, courtyards, repairs and roads, export.
- Refactored the map and registry modules: moved data loading, export and filter state into services, separated responsibilities between layers.
- Implemented a Keycloak integration widget that shows elements and pages based on user roles.
- Documented widgets in Confluence for low-code developers: how they work, input data, instructions.

Russian Union of Motor Insurers (NSIS) *09.2022 - 03.2025*

A unified workstation for insurance companies: OSAGO (compulsory motor liability), KASKO (motor hull), strict reporting forms accounting, claims settlement, master data. A microfrontend platform of 15 modules. Since November 2023 - the only frontend developer in a team of 20+ people.

Stack: React 18, TypeScript, Redux Toolkit, Module Federation, Webpack, Lerna, Storybook, React Final Form, React Table, Jest, React Testing Library

- Since November 2023, owned the platform's entire frontend: modules, UI kit, shared libraries and the host application.
- Split the UI kit into independent packages and configured Module Federation shared dependencies: initial load time dropped from 12 to 1.5 s, build size shrank from 80 to 50 MB.
- Eliminated circular dependencies between the host application, UI kit and shared packages by extracting common code into a separate module: dependency installation went from 10 minutes to 50 seconds.
- Developed the “Contracts” module for KASKO and property insurance: search, filtering, contract card, supplementary agreements, version history, CSV export.
- Added KASKO to the “Insured Events” module, which previously supported only OSAGO, with no regressions for OSAGO.
- Moved the strict reporting forms module to a BFF architecture and covered its pages with tests.
- Migrated the platform to React 18 and Node.js 18, decomposed the Webpack configuration, upgraded Storybook.
- Handed the project over to another company's team: ran onboarding and mentored two developers.

EDUCATION

MOSCOW STATE UNIVERSITY OF APPLIED BIOTECHNOLOGY Moscow

Incomplete higher education. Dairy Production, Milk and Dairy Products Technology *2020*

SKILLS

Core: TypeScript, JavaScript, React, React Router, HTML, CSS

Also worked with: Angular, Vue, RxJS

State & data: Redux Toolkit, Zustand, SWR, Axios, REST API

Forms: React Hook Form, React Final Form, Yup

Styling: SCSS/Sass, CSS Modules, styled-components, Tailwind CSS

Architecture: microfrontends (Module Federation), monorepo (Lerna), BFF, UI kit, role-based access (Keycloak)

Build & code quality: Vite, Webpack, Docker, Storybook, ESLint, Prettier, Husky

Testing: Jest, React Testing Library

Maps: Leaflet, 2GIS

Tools: Git, GitLab, Gerrit, Jira, Confluence, Figma

Processes: code review, Kanban, onboarding and mentoring

AI: Cursor, Claude, Codex, Perplexity

ADDITIONAL INFORMATION

English: B1 (intermediate)

Employment: full time; remote, office or hybrid

Citizenship: Russia
